Water Quality Status: Fecal Coliform Bacteria

April, 2022

Background: Clean water is a valuable resource; it is essential for human health and for the health of fish, shellfish, wildlife, and livestock. Water provides irrigation for crops and a safe place for water-based recreation. To maintain safe shellfish harvest, Washington State has developed standards for fecal bacteria in marine waters. Meeting the fecal coliform benchmarks in freshwater systems leads to satisfying the marine water standards to protect public health.

What are Fecal Coliform Bacteria?

Fecal coliform bacteria are found in human and animal feces. Detection in a creek is a sign that pathogens from these wastes may be polluting the water. Contact with fecal contaminated waters can result in **gastroenteritis, skin rashes, upper respiratory infections** and other illnesses.

Where Does the Bacteria Come From?

Potential sources of bacteria include:

- 1) Animal waste from livestock, domestic pets, and wildlife
- 2) Human sewage from failing septic systems, leaking sewer lines or cross-connections between sewer and stormwater systems

Other potential sources are continually being investigated.

Freshwater Benchmarks

Geometric Mean

Average sample contains less than:
100 fecal coliform/100mL

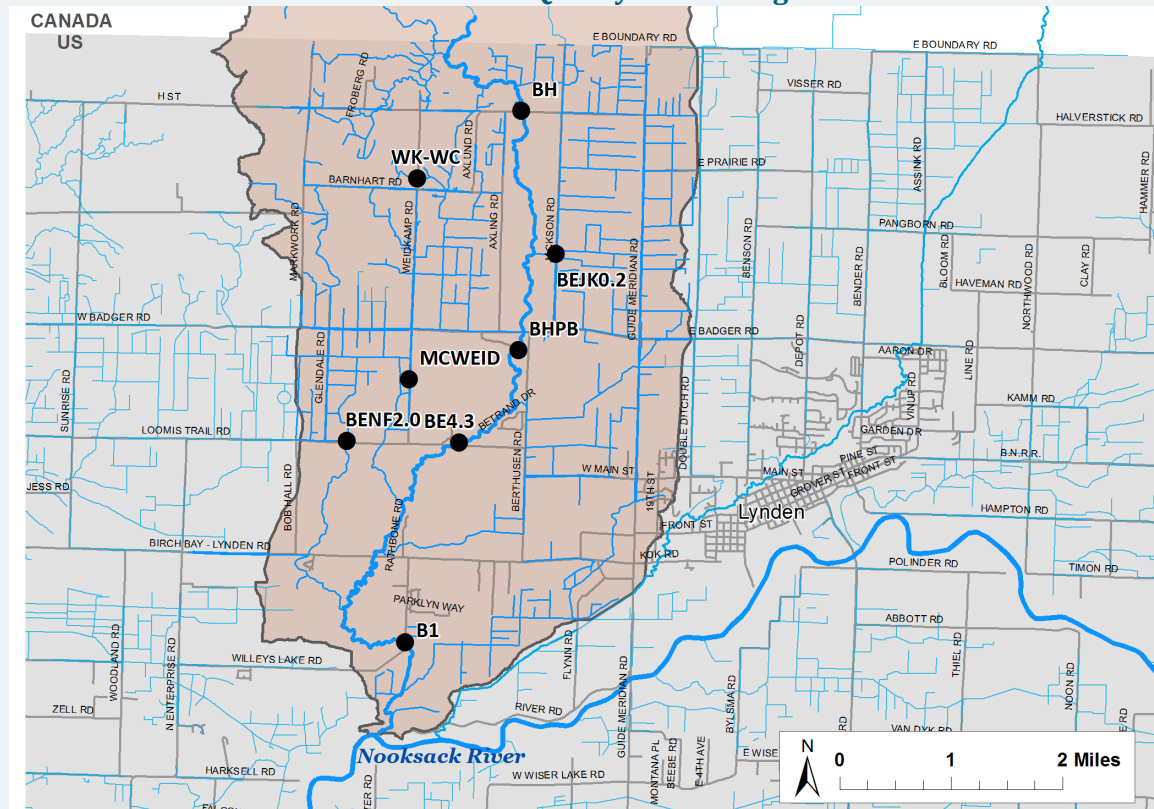

- and -

90th Percentile

Less than 10% of samples contain over:
200 fecal coliform/100mL

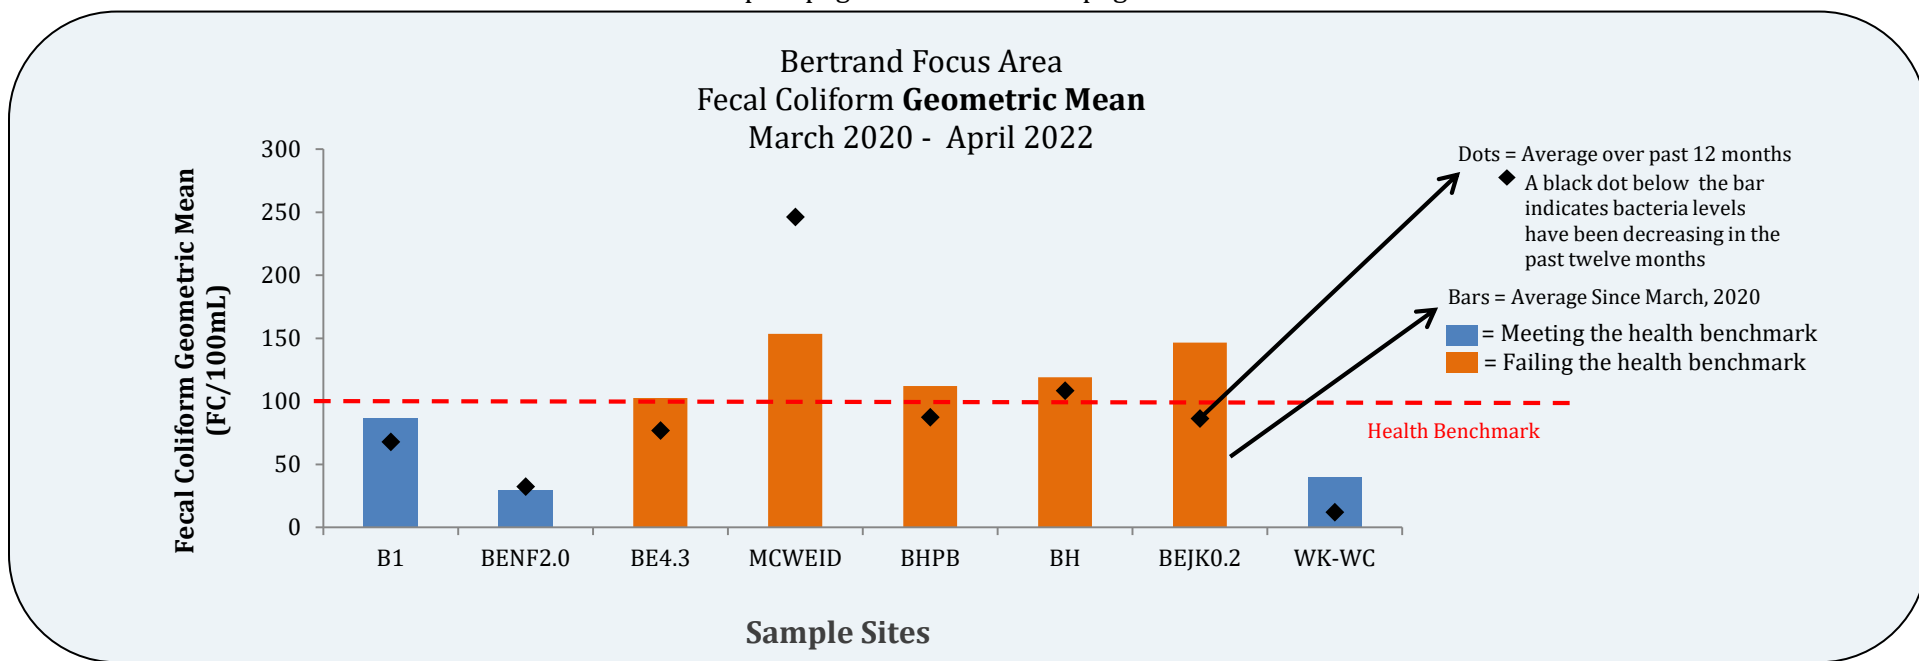

Routine Monitoring: The Bertrand Creek drainage has been identified as a **focus area** for water quality monitoring due to high levels of bacteria observed through the routine monitoring program. Whatcom County Public Works (WCPW) has monitored fecal coliform bacteria in the Bertrand Creek drainage area since March of 2020.

Bertrand Creek Focus Area *Mainstem Stations* Comparison of Bacteria Levels to Health Benchmarks

Refer to the map on page 1 or the table on page 3 for site locations.

*The bar must be blue on both graphs for the sample site to be meeting the freshwater health benchmark.

Bertrand Creek Focus Area

13-Month Historical Fecal Coliform Bacteria Data

This table provides the individual results at each station for the past thirteen months.
Results in light orange exceeded 200 FC/100mL. Results in dark orange exceed 1,000 FC/100mL.
